Modular Design

Separation of Concerns

A design principle: Isolate different parts of a program that address different concerns

A modular component can be developed and tested independently

Hog

Hog Game Simulator	Game Commentary	Player Strategies
• Game rules • Ordering of events • State tracking to determine the winner	• Event descriptions • User input	• Decision rules • Strategy parameters (e.g., margins & number of dice)

Ants

Ants Game Simulator	Actions	Tunnel Structure
• Order of actions • Food tracking • Game ending conditions	• Characteristics of different ants & bees	• Entrances & exits • Locations of insects

Example: Restaurant Search

Restaurant Search Data

Given the following data, look up a restaurant by name and show related restaurants.

```
{"business_id": "gclB3ED6uk6viWlolSb_uA", "name": "Cafe 3", "stars": 2.0, "price": 1, ...}
{"business_id": "WXKx2I2SEzBpeUGtDMCS8A", "name": "La Cascada Taqueria", "stars": 3.0, "price": 2}
...
{"business_id": "gclB3ED6uk6viWlolSb_uA", "user_id": "xVocUszkZtAqCxgWak3xVQ", "stars": 1, "text":
 "Cafe 3 (or Cafe Tre, as I like to say) used to be the bomb diggity when I first lived in the dorms
  but sadly, quality has dramatically decreased over the years....", "date": "2012-01-19", ...}
{"business_id": "WXKx2I2SEzBpeUGtDMCS8A", "user_id": "84dCHkhWG8IDtk30VvaY5A", "stars": 2, "text":
 "-Excuse me for being a snob but if I wanted a room temperature burrito I would take one home,
  stick it in the fridge for a day, throw it in the microwave for 45 seconds, then eat it. NOT go to
  a resturant and pay like seven dollars for one...", "date": "2009-04-30", ...}
...
```

(Demo)

Example: Similar Restaurants

Discussion Question: Most Similar Restaurants

Implement **similar**, a **Restaurant** method that takes a positive integer **k** and a function **similarity** that takes two restaurants as arguments and returns a number. Higher **similarity** values indicate more similar restaurants. The **similar** method returns a list containing the **k** most similar restaurants according to the **similarity** function, but not containing **self**.

```
def similar(self, k, similarity):
    "Return the K most similar restaurants to SELF, using SIMILARITY for comparison."

    others = list(Restaurant.all)

    others.____remove____(_____self_____)

    return sorted(others, key=_____lambda r: -similarity(self, r)_____)_____[:k]_____
```

sorted(iterable, /, *, key=None, reverse=False)
    Return a new list containing all items from the iterable in ascending order.

    A custom key function can be supplied to customize the sort order, and the reverse flag can be set to request the result in descending order.

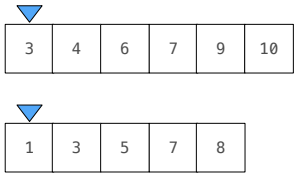
Example: Reading Files

(Demo)

Set Intersection

Linear-Time Intersection of Sorted Lists

Given two sorted lists with no repeats, return the number of elements that appear in both.



(Demo)

```
def fast_overlap(s, t):
    """Return the overlap between sorted S and sorted T.

    >>> fast_overlap([3, 4, 6, 7, 9, 10], [1, 3, 5, 7, 8])
    2
    """
    i, j, count = 0, 0, 0
    while ____________i < len(s) and j < len(t)____________:
        if s[i] == t[j]:
            count, i, j = ___count + 1, i + 1, j + 1___
        elif s[i] < t[j]:
            _____________________i = i + 1_____________________
        else:
            _____________________j = j + 1_____________________
    return count
```
